[As our economy continues to open up after massive lockdowns](#), there is no question we are feeling the effects of inflation.

[Now at a 13 year high](#), the overall measure of CPI for the month of July matched the highest reading of [headline CPI](#) since 2008 - an estimated rise of 5.4% over last year!

What does this inflation mean? Is inflation good or bad? How can inflation affect interest rates? All important questions, especially in the current environment of rising prices that we find ourselves in.

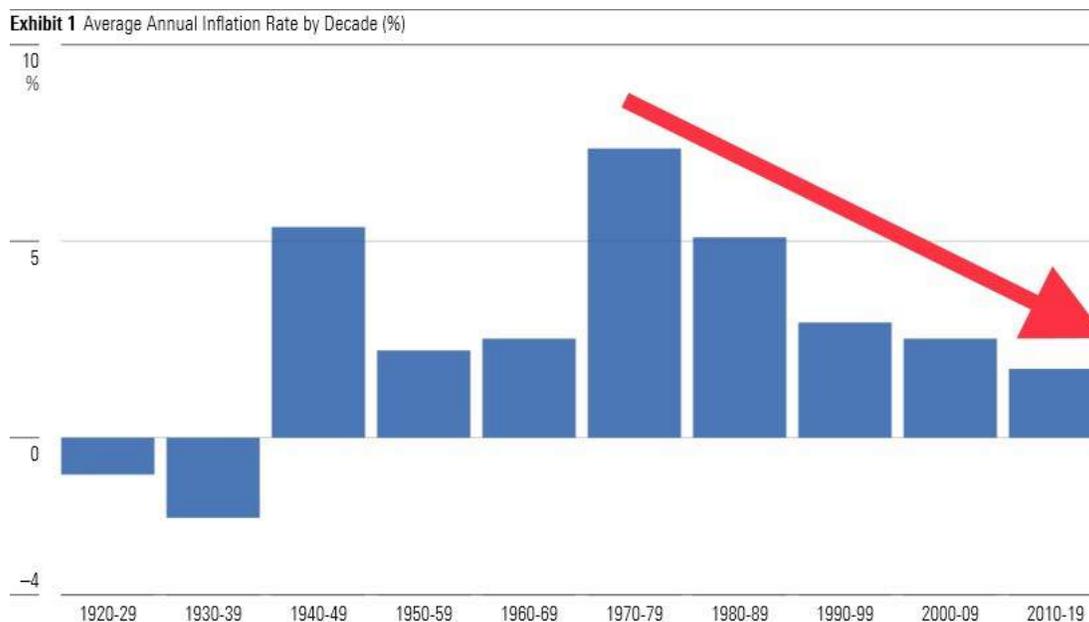

Opinion remains divided on whether consumer and producer price inflation rates will be "[transitory](#)" or "[enduring](#)" in the months ahead, and at [Towerpoint Wealth](#), we believe the jury is still out in terms of arriving at a definitive conclusion. Putting aside our skepticism about the ability of experts to accurately predict the future, a late June, 2021 survey of 52 economists found that 70% estimated the likelihood of inflation exceeding 3% in 2022 to be "somewhat unlikely" or "very unlikely."

The answers to the questions "What does inflation mean?" and "Is inflation good or bad" can be succinctly summarized like this:

1. **Inflation erodes purchasing power**, as it represents a decrease in the purchasing power of a currency due to a rise in prices
2. **Inflation encourages spending and investing**, as people buy and invest now, rather than later
3. **Inflation raises the cost of borrowing**, as interest rates tend to increase when inflation occurs (good for savers, bad for borrowers)
4. **Inflation reduces unemployment**, as unemployment falls, employers are forced to pay more for workers, and as wages rise, consumers tend to spend more
5. **Inflation increases growth**, as consumers and businesses have an incentive to spend and invest *today*, rather than *tomorrow*, when prices are assumedly higher

Before the pandemic, inflation had been in a [secular decline](#) since the 1970's:

Source: Morningstar Direct. Data as of February 28, 2021.

Clearly 2021 has been different, and at least for the time being, this secular decline is over. Understanding that [inflation is an important force that can dictate the performance and stability of an economy](#), we have our fingers crossed that the "slow and steady" inflationary environment of the past three decades returns, subsequent to our economy continuing to normalize after the roller coaster it has been on since March of last year.

What's Happening at TPW?

Our Client Service Specialist, [Michelle Venezia](#), moved from crabbing to clubbing while on her [Norwegian Cruise Line](#) cruise through Alaskan waters earlier this month, with [Ketchikan](#) being the port of call!

You look great in both photos Michelle, glad to see you having so much fun on your vacation!

Alaska has definitely been the theme at [Towerpoint Wealth](#), as our [Director of Tax and Financial Planning, Steve Pitchford](#), went on an epic adventure with his partner, Katie, touring and hiking through [Denali National Park and Preserve](#) late last month!

Think long term. Patience pays...

Usain Bolt won 8 gold medals in 3 Olympics, and he only ran for less than 115 seconds on the track, earning \$119 million dollars. That's economy of effort.

But for those 2 minutes, he trained for 20 years. That's investment. Think long term. Patience pays.

Broken record - think long term - patience pays!

Introduction to U.S. Economy: Inflation

What is Inflation?
Inflation is defined as a general increase in the price of goods and services across the economy, or, in other words, a general increase in the cost of living. One result of inflation is a general decrease in the purchasing power of money. Inflation is a general increase in the price of goods and services across the economy, or a general increase in the value of money.

As inflation occurs, individuals can purchase fewer goods and services with the same amount of money. For this reason, an individual would need about \$100 in 2020 to purchase the same amount of goods and services as an \$118 would have purchased in 1980. Measurements of inflation are used to adjust money figures to keep purchasing power constant over time. Among the more accurate comparisons across disparate time periods, Monetary figures that have been adjusted for inflation are referred to as real and base inflation-adjusted figures are referred to as nominal.

Measuring Inflation
The rate of inflation can be measured by tracking changes in the average price of a constant set of goods and services, referred to as a market basket. Inflation is generally measured using price indices such as the Consumer Price Index (CPI). A price index is constructed by dividing the price of a market basket in a given year by the price of the same basket of goods in a base year. The rate of inflation is then measured by calculating the percent change in the price index across different time periods. For example, the CPI rose about 37% in November 2019 and about 20% in November 2020, which amounts to an inflation rate of about 1.7% over this 12-month period.

Alternative Measures of Inflation
Alternative price indices will use different goods within the market basket to adjust generally used or different.

Notes: Annual percentage changes measured by Personal Consumption Expenditures Index.

Complications in Measuring Inflation
The fundamental concept behind inflation is to measure changes in the price of the same goods and services over time. However, in reality, this is nearly impossible for two reasons. First, the quality of goods and services change over time. As such, some products are increasing prices over time due to improvements in quality rather than inflation. Second, some products are introduced into the market that were not in the market in the base year.
